Patent No. 6531315

GENERAL INFORMATION:

APPLICANT: Wang, Tidun

APPLICANT: Ralos, Michael D.

APPLICANT: Bangur, Chaitanya S.

APPLICANT: Asmuel X.

APPLICANT: Skeiky, Yasir A.W.

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY

TITLE OF INVENTION: COMPOSITIONS OF LUNG CANCER

FILE REFERENCE: 210121.455C9

CURRENT APPLICANT: ON NUMBER: US/09/606,421B

CURRENT FILING DATE: 2000-06-28

NUMBER OF SEQ ID NOS: 358

Result Š.

Mouse Urogenital Sinus (UGS) tissue was isolated from 17 day old mouse embryos. The UGS cells were infected with retroviruses, cultured and implanted under the renal capsule of mice. Reconstitutions were harvested 5 weeks later, when they showed signs of distress from the tumour burden. Metastasised tumours were isolated from a site outside the renal capsule. RNA was isolated from primary tumours and metastases, reverse transcribed and subjected to differential display PCR. The sequences were analysed to obtain metastatic sequences e.g. the sequence encoding the present sequence. The method can be used to detect, diagnose and treat disorders related to metastasis, or treat malignant or non-malignant disorders, e.g. hyperplasia, dysplasia and hypertrophy. The metastatic sequence can be used to screen a biological sample for metastasis, and it or its expression product may also be used to treat a metastatic disorder Disclosure, Fig 12CI; 102pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel isolated polypeptide (I) which comparising an immunogenic portion of a lung tumor protein or variant (P2) which have cytostatic activity. The polypeptides and polymoleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient est tracted with P2, polymucleotides encoding P2 or antigen presenting development of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TACATGAGGGAG 179

neurokin-1 type (HGFIN) polypeptide. HGFIN induces white blood cell differentiation and inhibits progenitor proliferation. HGFIN polypeptides and polymucleotides are useful for treating a disease associated with abnormal bone marrow cell differentiation or proliferation, especially acute myeloid leukemia, acute lymphocytic leukemia, chronic myeloid leukemia, leukemia, hodgkin's and non-Hodgkin's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ATTATGTTTGATGTCCTGATTCATGATCCTAGCCACTTCCTCAATTATTCTACCATTAAC 898

comprising the lung tumour proteins, polynucleotides, antibodies, fusion proteins, T cell populations, or antigen presenting cells that express the lung tumour proteins are useful for treating lung acncer or stimulating an immune response. ABL48959 to ABL49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                             The present invention describes human lung tumour proteins. Human lung tumour proteins and polynucleotides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions
                                                                                                                                                                                                                 Polynucleotides encoding lung tumor polypeptides, lung cancer or stimulating an immune response.

The present invention describes isolated human lung carcinoma computation describes isolated human lung carcinoma delivity, and can be used in gene therapy and in vaccines. Compositions activity, and can be used in gene therapy and in vaccines. Compositions comprising (I) or (II) can be used for stimulating an immune response in a patient and for treating lung cancer in a patient. Oligonuclectides of containing a biological sample from the patient, contacting the biological sample from the patient, contacting the biological sample with the oligonuclectide, detecting in the sample, an amount of polynucleotide that hybridises to the oligonucleotide and comparing the amount of polynucleotide that hybridises to the oligonucleotide to a cancer in the patient. (I) and (II) are useful in pharmaceutical compositions, e.g. vaccines. (I) is useful as a marker to indicate the presence or absence of a cancer such as lung cancer. Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.

Claim 27; Page 328; 453pp; English.

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynuclectide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynuclectides and polypeptides are used for identifying a compound that medulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensativity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodises. Sequences ABU56048-ABU56745 represent lung cancer-associated polypeptides of the

osteoactivin

and

quu

detection of

```
The invention describes an isolated and substantially pure osteoactivin protein (1) that stimulates bone cell differentiation. A therapeutic composition comprising (1), the polynuclectide (1) encoding (1) or a biologically active fragment of (1) is useful for trimulating bone formation in a mammal. The composition is also useful for treating a bone disorder including osteoporosis and periodontal disease. A second therapeutic composition comprsising an anti-(1) antibody or an agent that inhibits osteoactivin-mediated bone formation is useful for inhibiting formation in a mammal. The second composition is also useful for treating correction in a mammal. The second composition is also useful for treating for developing novel therapeutic compositions for bone disorders, and for stimulating osteogenesis. The polynucleotide is also useful in gene therapy. This is the amino acid sequence of human nmb, a homologue of the rat osteoactivin of the invention used in the creation of antibodies for

The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified composite and known adipocyte marker and then by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by performing a generating domains) proteins. Also included are a polymucleotide encoding a polypeptide in the adipocyte cells, a compinant host cell expressing at least one of the interacting recombinant host cell expressing at least one of the interacting compound in adipocyte cells, a sID (RTM) polypeptide comprising any of the 738 amino acid comprising the specification (including its fragment or variant), a squences given in the specification (including its fragment or variant), a vector comprising the vector, a protein chip comprising the polypeptides and a recombinant host cell comprising the vector, a protein chip comprising the polypeptides and a compounds are useful for preventing or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful as probes or primers. The complex is preventing or treating metabolic disorders such as obesity or diabetes. The polymucleotides are useful as probes or primers. The complex is comprising the therapeutic effect. The present sequence represents a SID (RTM) protein of the invention
                                                                                                                                                                                                 New complex between two interacting proteins in adipocyte cells, useful for identifying selected interacting domains that modulate protein interactions, or for preventing or treating metabolic disorders such as obesity or diabetes.
                                                                                                                                                                                                                                                                                                                    Claim 6; Page 269-270; 382pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                779
for diagnosing, preventing and/or treating cancer, particularly lung defined nucleotide sequences (e.g. 1012, 900 or 2773 bp) given in the specification; complements of the nucleotide sequences cited above; at least 10 contiguous residues of the nucleotide sequences cited above; at sequence that hybridise to any of the nucleotide sequences cited above; a stringent conditions; a sequence that is at least 75 or 90% identical to the above nucleotide sequences; or degenerate variants of the above nucleotide sequence; or degenerate variants of the above nucleotide sequences. The composition and methods are useful in gene therapy and in vaccines. This is the amino acid sequence encoded by a human lung tumour cDNA isolated from a lung squamous cell carcinoma that may be useful in the diagnosis and treatment of lung cancer and

WPI; 2003-779081/73. N-PSDB; ADD78274.

New polypeptides and polynucleotides associated with cell growth, differentiation and death, useful for diagnosing, treating or preventing e.g. developmental, neurological, autoimmune, inflammatory or reproductive disorders.

Claim 1; SEQ ID NO 16; 320pp; English.

The present invention relates to novel human proteins (1; ADD78220-ADD78258) and their coding sequences (II; ADD78259-ADD78297), which are associated with cell growth, differentiation and death, referred to as CGDD-n proteins, where n is a number from 1 to 39. The CGDD proteins and their coding sequences are useful for diagnosing, treating or preventing cell proliferative disorders (e.g. cirrhosis, hepatitis, arences or cancers (e.g. cirrhosis, bone marrow, brain, breast, colon, kidney, liver, lung or uterus), developmental disorders of e.g. renal tubular acidosis, Becker muscular dystrophy, gonadal dysgenesis, hypothyroidism or saizures), neurological disorders (e.g. pick's disease, cataract, epilepsy, ischemic cerebrovascular disease, autoimmune/inflammatory disorders (e.g. Albs, allergies, anemia, asthma, autoimmune/inflammatory disorders (e.g. Albs, allergies, anemia, asthma, diabetes mellitus, bronchitis, osteoprosis, osteoarthritis, rheumatoid arthritis, contact demantitis or gout), viral, bacterial, fungal, parastic, protozoan or helminthic infections, reproductive disorders (e.g. infertility, ectopic pregnancy, premature ovarian failure, delayed choriccarcinoma, placenta previa, placental cor maternal floor infarction or chronic villitis).

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, tumour. Dreast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in perioyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating or inhibiting the proliferation of normal human blood, for stimulating or inhibiting the proliferation of normal human blood, fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue tryping. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AMU83592-AAU83713 represent human PRO protein sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ATGGAATGTCTCTACTATTTCCTGGGATTTCTGCTCCTGGCTGCAAGATTGCCACTTGAT 119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
```

One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating tumor.

Claim 11; Fig 42; 314pp; English.

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS0739-ABUS0860 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence USPTO web site at sequence USPTO web site at sequence.

New genes, and its encoded secreted and transmembrane polypeptides, useful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or pericyte proliferation, especially for treating lung tumors, arthritis or wounds in a mammal.

Claim 11; Fig 42; 314pp; English.

The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting tumour, colon tumour, breast tumour, prostate tumour, secral tumour, or liver tumour) or timulating the proliferation of differentiation of chondrocyte for stimulating proliferation of inferentiation of chondrocyte cells, for stimulating proliferation of pericyte cells, or for modulating nor polypeptide is also useful for treating tumours or various bone and/or cartilage disorders (e.g. sports injuries or articularly as targets or PRO polypeptides are useful in drug screening, particularly as targets of the their petul cintervention in these diseases, and in the diagnostic or Arearing the properties of the properties of the properties of the properties of the process of the process of the properties of the process of determination of the presence of these diseases. The PRO polyptides are also useful as molecular weight markers, or for chromosome lidentification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide

The invention describes one hundred and eighty seven nucleic acids encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agoniests and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or anglogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atheroselerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebtis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21 AlaAlaLySAXGPheHiSASpValLeuGlyAsnGluAxGProSerAlaTyrMetArgGlu

The molecules of the invention may be useful for stimulating proliferation or gene expression in perioyte cells or the release of INF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding for a PRO protein, useful for the manufacture of a medicament for diagnosing or treating tumors or for measuring or detecting expression of an associated gene.

Pranela R;

WPI; 2002-657531/70. P-PSDB; ABB78200 Hematopoietic growth factor inducible neurokin-1 type polypeptide and polynucleotide for treating a disease associated with abnormal bone marrow cell differentiation or proliferation, e.g. leukemia.

Claim 2; Page 121-123; 125pp; English.

The present sequence encodes human haematopoietic growth factor inducible

480 540 540 600 009 099 099 720 720 780 780 neurokin-1 type (HGFIN) polypeptide. HGFIN induces white blood cell differentiation and inhibits progenitor proliferation. HGFIN polypeptides and polymucleotides are useful for treating a disease associated with abnormal bone marrow cell differentiation or proliferation, especially acute myeloid leukemia, acute lymphocytic leukemia, chronic myeloid leukemia, acute lymphocytic leukemia, chronic lymphocytic leukemia, sand non-Hodgkin's 240 240 360 420 480 120 120 180 180 300 300 360 420 09 60 GTCAGTATTTCCAGAAATTGGGACGATGTTCAGTGAGAGTTTCTGTGAACACACAGCCAATG CTTTTCCTCACCACCACGGATGGAGAAGATGGAGAATTTCATCTACGTCTTCCACACACTTG TGACACTTGGGCCTCAACTCATGGAAGTGACTGTCTACAGAAGACATGGGACGGGCATATG TGACACTTGGGCCTCAACTCATGGAAGTGACTGTCTACAGAAGACATGGACGGGCATATG ACAATCAATTAAATGGCTGGTCTTCTGATGAAAATGACTGGAATGAAAAACTCTACCCAG TGTGGAAGCGGGAACATGAGGTGGAAAAACTCCTGGAAGGGAGGCCGTGTGCAGGCGG TGTGGAAGCGGGGAGACACATGAGGTGGAAAAACTCCTGGAAGGGAGGCCGTGTGCAGGCGG TATTCCCTAGATGCCAAAAGGAAGATGCCAATGGCAACATAGTCTATGAGAAGAACTGCA TATTCCCTAGATGCCAAAAGGAAGATGCCAATGGCAACATAGTCTATGAGAAGAACTGCA GAAATGAGGCTGGTTTATCTGCTGATCCATATGTTTACAACTGGACAGCATGGTCAGAGG GAAATGAGGCTGGTTATCTGCTGATCCATATGTTTACAACTGGACAGGCATGGTCAGAGG ACAGTGACGGGGAAAATGGCACCGGCCAAAGCCATCATAACGTCTTCCCTGATGGGAAAC ACAGTGACGGGGAAAATGGCACCGGCCAAAGCCCATCATAACGTCTTCCCTGATGGGAAAC CTTTTCCTCACCACCCCGGATGGAGAAGATGGAATTTCATCTACGTCTTCCACACACTTG GTCAGTATTTCCAGAAATTGGGACGATGTTCAGTGAGAGGTTTCTGTGAACACAGCCAATG TTCCCATCGCACAAGTGAAAGATGTGTACGTGGTAACAGATCAGATTCCTGTGTTTGTGA CGGCACGAGGCCCCAGAGGAATAAGTTAACCTTGGTGCCTGCGTCCGTGAGAATTCAGCA CCGCCAAACGATTTCATGATGTGTGCCAATGAAAGACCTTCTGCTTACATGAGGGGG ACAATCAATTAAATGGCTGGTCTTCTGATGAAATGACTGGAATGAAAAACTCTACCCAG TCCTGACCAGTGACTCACCAGCCCTCGTGGGCTCAAATATAACATTTGCGGTGAACCTGA TGGAATGTCTCTACTATTTCCTGGGATTTCTGCTCCTGGCTGCAAGATTGCCACTTGATG rggaargrererarrrecragaarrrergerecragaagarraccattara CCGCCAAACGATTTCATGATGTGCTGGGCAATGAAAGACCTTCTGCTTACATGAGGGAGC CGGCACGAGGCCCCAGAGGAATAAGTTAACCTTGGTGCCTGCGTCCGTGAGAATTCAGCA Gaps ., 2661; Other; Indels 0 ë, , 9 . 0 0 .. ```
Mouse Urogenital Sinus (UGS) tissue was isolated from 17 day old mouse embryos. The UGS cells were infected with retroviruses, cultured and implanted under the renal capsule of mice. Reconstitutions were harvested beeks later, when they showed signs of distress from the tumour burden. RNA was isolated from primary tumours and metastases, reverse transcribed and subjected to differential display PCR. The sequences were analysed to obtain metastatic sequences, e.g. the present sequence. The method can be used to detect, diagnose and treat disorders related to metastasis, or treat malignant or non-malignant disorders, e.g. hyperplasia, dysplasia and hypertrophy. The metastatic sequence can be used to screen a biological sample for metastasis, and it or its expression product may also be used to treat a metastatic disorder
                                                                                                           tumour metastatic sequences - by introducing transfected nost mammal and analysing primary and metastatic sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28 AACCIIGGIGCCIGCGICCGIGAGAAIICAGCAIGGAAIGICICIACIALIICCIGGGAI

Mouse Urogenital Sinus (UGS) tissue was isolated from 17 day old mouse embryos. The UGS cells were infected with retroviruses, cultured and implanted under the renal capsule of mice. Reconstitutions were harvested beeks later, when they showed signs of distress from the tumour burden. RNA was isolated from primary tumours and metastases, reverse transcribed and subjected to differential display PCR. The sequences were analysed to obtain metastatic sequences, e.g. the present sequence. The method can be treat malignant or non-malignant disorders, e.g. hyperplasia, dysplasia and hypertrophy. The metastatic sequence can be used to screen a biological sample for metastasis, and it or its expression product may also be used to treat a metastatic disorder. Identifying tumour metastatic sequences - by introducing transfected cells into host mammal and analysing primary and metastatic sequences differential display PCR. Disclosure, Fig 12BT; 102pp; English.

The present invention describes a method for screening drug candidates.

The method comprises adding a drug to a cell that expresses an expression profile gene encoding a protein encoded by 5 sequences of defined base profile gene encoding a protein encoded by 5 sequences of defined base comparison in C55619, C55614, C55614, C55614 and C55630 or a sequence comparison of the expression number X9251, X6246, J04130, X62087 and X76534 (or a fragment) and determining the effect of the drug on the expression profile gene. An inhibitor of matrix metalloproteinase 19 (MMD-19), preferably an antibody, is useful for treating destructive macrophage disorders (DMD) by inhibiting DM development in a cell of an individual having arthritis. Antibodies to MMD-19 are useful for localising a therapeutic moiety preferably cyclocaric agent or a radioisotope to colorectal cancer tissue. A composition comprising MMP-19 is useful for eliciting an immune response in an individual. C55635 to C55710 represent human differentially credible comparison of the invention. The present sequence represents the human NMB cDMA sequence according to the Genbank accession number X76534.

It is specifically claimed by its Genbank accession number is not in the present specification, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Screening drug candidates comprises adding a drug to a cell expressing an expression profile gene and determining the effect of the drug on the expression of the expression profile gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              88 ITCTGCTCCTGCCTGCAGALTGCCACTTGATGCCGCCAAACGATTTCATGATGTGCTGG 147

              involve altered bone metabolism (e.g. idiopathic juvenile osteoporosis), skeletal disease linked to breast cancer, mastocytosis, Fanconi syndrome or fibrous dysplasia. The present sequence is that of an osteoblast differentiation associated cDNA marker of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GTTCAGTGAGAGTTTCTGTGAGACACAGCGAATGTGACACTTGGGCCTCAACTCATGGAAG

```

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polypeptide for identifying a compound that modulates a lung cancer-associated polypeptide. For inhibiting proliferation of a lung cancer-associated polypeptide. For cinhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by cancering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell ung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, thypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, bronchiectasis. The genes, polymucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences and as targets for screening for therapeutic approximately approximate that modulate that encare, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polynucleotides of

\*W polypeptides and polynucleotides associated with cell growth, fferentiation and death, useful for diagnosing, treating or preventing g. developmental, neurological, autoimmune, inflammatory or reproductive disorders e.g.

2003-779081/73.

WPI; 2003-779081/ P-PSDB; ADD78235.

PG;

SEQ ID NO 55; 320pp; English. Claim 5;

The present invention relates to novel human proteins (1; ADD78220-ADD78288) and their coding sequences (II; ADD78259-ADD78297), which are associated with cell growth, differentiation and death, referred to as CGDD-n proteins, where n is a number from 1 to 39. The CGDD proteins and their coding sequences are useful for diagnosing, treating or preventing cell proliferative disorders (e.g. cirrhosis, hepatitis, arteriosclerosis, poriasis, primary thrombocytopenia) or cancers (e.g. arteriosclerosis, poriasis, primary thrombocytopenia) or cancers (e.g. denocarcinoma, sarcoma or cancers of the bone, bone marrow, brain, breast, colon, kidney, liver, lung or uterus), developmental disorders (e.g. tenal tubular acidosis, Becker muscular dystrophy, gonadal dysgenesis, hypothyroidism or selzures), neurological disorders (e.g. Pick's disease, cataract, epilepsy, ischemic cerebrovascular disease, stroke, Alzheimer's disease, Parkinson's disease or dementia), autoimmune/inflammatory disorders (e.g. AIDS, allergies, anemia, asthma, diabetes mellitus, bronchitis, orteoporosis, osteoarthritis, rheumatoid arthritis, contact dermatitis or gout), viral, bacterial, fungal, contact dermatitis or gout), viral, bacterial, fungal, contact dispersion or helminthic infections, reproductive disorders (e.g. riferial), e.g. riferialis, contact dermatitis infections, reproductive disorders (e.g. riferialis). (e.g. infertility, ectopic pregnancy, premature ovarian failure, delayed puberty or prostatitis) or disorders of the placenta (e.g. preeclampsia,

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for the proliferation of cancer, and inhibiting the proliferation of normal human blood, for stimulating or inhibiting the proliferation of normal human dermal flor bushast cells. The PRO polypeptide may also be used as molecular wighth markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABR3356. Tepressent human PRO protein coding sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                            One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnostic assays for PRO, by detecting its expression in Specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ACA66841-ACA66862 represent comb. As equences encoding the human PRO polypeptides of the sinvention. Note: The sequence data for this patent was obtained in sequence companies and the sequence sequences are sequented as sequences are sequenced as a for this patent was obtained in sequence users.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; PRO polypeptide; secreted and transmembrane protein; anti-PRO antibody; diagnostic assay; gene expression; tumour; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Godowski PJ;

useful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or pericyte proliferation, especially for treating lung tumors, arthritis or wounds in a mammal.

Claim 2; Fig 41; 314pp; English

The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. These are tumour, breast tumour, prostate tumour, rectal tumour, or liver tumour. Or a mammal, for atimulating the release of TNF-alpha from human blood, cells, for stimulating proliferation of deficentiation of chondrocyte cells, for stimulating proliferation of pericyte cells, or for modulating normal human dermal fibroblast proliferation. The PRO nucleic acid or polypeptide is also useful for treating tumours or various bone and/or carillage disorders (e.g. sports injuries or arthritis), or wounds. The catilage disorders (e.g. sports injuries or atthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for therepeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This sequence encodes a novel human secreted and transmembrane PRO polypeptide

The invention describes one hundred and eighty seven nucleic acids encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, agerelated macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation bushers, and in chromosome and gene mapping. This sequence encodes a novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       109

The invention relates to a novel isolated PRO protein encoding nucleic acid. The nucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrocyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO cDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ACGIGGIAACAGAITCCTGIGITTGIAGACIATGITCCAGAAGAACGAICGAAATT

The invention relates to an isolated mucleic acid encoding a PRO polypeptide. Nucleic acids that encode PRO can be used to generate either transgenic animals or knock-out animals useful in developing and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy for replacing defective gene, in chromosome identification, as chromosome markers, or in generating probes to isolate full length PRO CDNA. The PRO polypeptides are useful for chondrocyte stimulation, TNF-alpha stimulation, human dermal fibroblasts stimulation and the isolated nucleic acids may be used for recombinantly expressing and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for pro and in affinity purification of PRO from recombinant cell culture or natural sources. The present sequence represents cDNA encoding a human expression expression that all sequence represents cDNA encoding a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         147
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       207

This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically coverned by information received from other cells and the immediate of polypeptides (for example mitogenic factors, survival factors, cytotoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors or membrane bound proteins. These membrane bound proteins and receptors may be of use as proteins. These membrane bound proteins and proteins and proteins of the coptors and diagnostic agents, such as in the blocking of receptor content interpreted by diverse cell receptors and proteins along with the cDNA sequences encoding them. The novel proteins of the convention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tumour in a membrane bound respect to the copy of a tumour associated gene. The present sequence is the cDNA may have copy the copy of the measuring or detecting the copy may not account of the measuring or detecting the copy may not not they may be useful for measuring or detecting the copy manual. In addition, they may be useful for measuring or detecting the copy manual.
                                                                                                                                                                                          Human; PRO; membrane bound protein; membrane bound receptor; cell proliferation; cell migration; cell differentiation; mitogenic factor; survival factor; cytotoxic factor; differentiation factor; neuropeptide; hormone; cell receptor; receptor-ligand interaction; cytostatic; chondrocyte; tumour; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PJ,

Sequence 225, Application US/09850716A

Patent No. US2002011519A1

GENERAL INPORMATION:
APPLICANT: Kalos, Michael D.
APPLICANT: Retter, Marc W.
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY
TITLE OF INVENTION: COMPOSITIONS AND INSTHODS FOR THE THERAPY
TITLE OF INVENTION: US/09/850.716A

FILE REFERRINCE: 210121.455015
CURRENT FILING DATE: 2001-05-07
NUMBER OF SEQ ID NOS: 440

SEQ ID NO 225
